

Information about *Cryptosporidium* Infection

Why Have You Been Given This Leaflet?

Your local council has a responsibility to investigate food poisoning and certain incidents of infectious disease. An officer from your local council's Environmental Health Department is contacting you to try and find out where your infection may have come from and to give advice on preventing further spread to others.

NHS Tayside Health Protection Team has notified your local Environmental Health Department that you or one of your household is suffering from a *Cryptosporidium* infection. They are often the first to tell you what type of infection you have rather than your General Practitioner (GP).

The aim of this leaflet is to give you information and to answer some of the most frequently asked questions about in *Cryptosporidium* infection. **Please take time to read this leaflet.**

What is *Cryptosporidium* infection?

Cryptosporidium infection is caused by a parasite called *Cryptosporidium parvum*. This is an organism that lives in the bowels of an infected person or animal. It can cause gastro-enteritis (bowel upset) in people.

Where does it come from?

The parasite can cause diarrhoea in wild and domestic animals such as cattle, sheep, dogs, cats and birds. It can be passed between animals and people, and can also contaminate water. It can be found in springs, burns, lochs and rivers and, sometimes, swimming pools.

How can you get *Cryptosporidium* infection?

You can become infected by swallowing the parasite in a number of ways

- By not washing your hands thoroughly after touching faeces from another person or animal, for example when changing a nappy or from infected pets
- Touching animals particularly young ones such as lambs, calves, puppies or kittens and not washing hands after wards
- Drinking or swimming in contaminated or untreated water e.g. rivers, wells, springs or burns
- Occasionally you can be infected by eating and drinking contaminated food particularly unpasteurised milk, offal (liver, kidneys and heart) or undercooked meat.

What are the usual symptoms?

The main symptoms are

- Watery diarrhoea
- Stomach pains
- Dehydration
- Weight loss
- Fever

When do the symptoms start?

The symptoms usually start 7 to 14 days after swallowing the parasite, although it can be as short as 1 day and as long as 21 days. HPT manual states 1-12 days and HPA 7-10 days, so feel our guidance probably fine.

How long will the symptoms last?

Symptoms could last for up to 3 weeks. You might think that you are getting better and have shaken off the infection but then find that you get worse before the illness eventually goes.

How do you treat a *Cryptosporidium* infection?

There is no specific treatment. Most people with a healthy immune system will recover within one month.

It is important to drink fluids to replace the water lost through having diarrhoea and vomiting. This applies particularly for babies, children and the elderly.

If a young child has symptoms or if your symptoms continue or are particularly severe, consult your GP or seek medical advice from NHS 24.

Do I need to stay off nursery, school, work, or other activities?

Yes, it is important to stay at home until you have had no vomiting or diarrhoea for 2 days. You should not go swimming until you have had no symptoms for **2 weeks**.

What should I do if I have symptoms again?

If your symptoms return or become more severe (e.g. blood in diarrhoea) you should see a GP or seek medical advice from NHS 24.

What should I do if I know of others with similar symptoms?

If a young child develops symptoms or if an adult has symptoms which are severe or last for more than 2 days they should consult their GP or seek medical advice from NHS 24.

They should, if possible, submit a stool sample via their GP.

You should tell the officer of the Environmental Health Department the details of the others you know to be ill. This information can help in identifying sources of infection

How can you avoid getting or passing to others a *Cryptosporidium* infection?

Wash your hands thoroughly with soap and warm water

- Before preparing, handling or eating foods
- After handling raw food especially meat or poultry
- As soon as possible after working, feeding, grooming or playing with pets and other animals
- You should pay special attention to hygiene during farm visits, washing hands after any contact with animals, and eating only in designated areas
- After going to the toilet or changing a child's nappy
- By ensuring young children wash their hands.

Handle food and drink safely

- Thoroughly cook meat and poultry so that they are cooked all the way through, and no blood runs from them
- Thaw frozen food properly before cooking
- Always reheat food thoroughly
- Do not use the same knives, chopping boards and equipment for preparing raw foods and cooked or ready to eat foods
- Thoroughly clean knives, chopping boards and equipment used for preparing raw foods with hot water and detergent after each use
- Never put cooked food back on an unwashed plate previously used for uncooked meat
- Do not wash raw poultry because this will splash germs around
- Store cooked or ready to eat food in the fridge separately from raw meats. Raw foods should not be stored above or beside cooked or ready to eat food. Store uncooked meat on the bottom of the fridge to avoid dripping raw meat juices onto other food
- Wash all fruit, salads and vegetables that are to be eaten raw
- Do not drink untreated water or unpasteurised milk
- Do not use ice or drinking water in countries where the water supply might be unsafe
- Do not buy ready to eat foods from shops where you believe food hygiene standards are poor. Report such places to your local Environmental Health Department
- **Do not** prepare food for others until your diarrhoea and vomiting symptoms have been stopped for 48 hours.

Household Measures

Whilst you have symptoms you need to be scrupulously clean around your home.

- Make sure all members of your household wash their hands thoroughly with soap and hot water after going to the toilet and after handling soiled clothing or bedding
- Make sure that everyone has their own towel and that they do not use anybody else's
- Wash all soiled clothes, bedding and towels in the washing machine on the hottest cycle that the manufacturer would recommend
- Clean toilet seats, toilet bowls, flush handles, taps and wash hand basins after use with detergent and hot water, followed by a household disinfectant.

Water Safety

- Do not use swimming pools (including hot tubs and paddling pools, etc.) if you have diarrhoea. For a *Cryptosporidium* infection this is until you have had no symptoms for **2 weeks**.
- Do not swim in water that may be contaminated
- Do not drink untreated water and avoid swallowing water when in lakes and swimming pools
- If your water supply is from a private water source please discuss this with the Environmental Health Department.

Where can you get further advice?

If you would like any further advice about *Cryptosporidium* infection or food hygiene, please contact your local Environmental Health Department. The local offices are listed below.
